

MAXBIT Instructions

- 1.** Open the chuck of the drill, insert the non-pointed end of THE MAXBIT into the drill chuck and tighten securely.
- 2.** Slowly engage the drill to test speed and verify it does not wobble or is loose in the chuck.
- 3.** Aim the pointed end of THE MAXBIT down where you want to dig your hole.
- 4.** Engage the drill trigger just above the soil and push while THE MAXBIT digs a perfect hole.
- 5.** Allow THE MAXBIT to dig down the depth of the blade and pull it out of the hole while drill is still engaged, disengaging when you get to the top of the hole.
- 6.** Insert your plant into the hole and cover with the dirt around the top of the hole.

Note: The drill bit is best used in tilled soil. For use in untilled soil, always prepare the soil with water before using the drill bit.
